

Amendments to the Claims:

1. (Previously Presented) A latch for a rechargeable battery pack, comprising:
 - a. a planar member configured for insertion to the rechargeable battery pack in a first linear direction;
 - b. at least one spring retention post coupled to the planar member configured to receive a spring force of the rechargeable battery pack directed in a second linear direction opposite the first linear direction;
 - c. at least one insertion snap coupled to the planar member configured to resist the spring force and maintain the planar member at a particular position relative to the rechargeable battery pack until released therefrom; and
 - d. at least one barbed wing member coupled to the planar member, extending distally outward from the planar member, wherein the at least one barbed wing member supports a pair of barbs extending perpendicularly from the at least one barbed wing member.
2. (Original) The latch of claim 1, further comprising at least one mechanical stop coupled to the planar member.
3. (Original) The latch of claim 2, further comprising at least one barbed wing member support, wherein the at least one barbed wing member support extends perpendicularly from the planar member such that the barbed wing member is in a non-coplanar geometric relationship with the planar member.
4. (Original) The latch of claim 2, further comprising a finger grip on the planar member.

5. (Original) The latch of claim 1, wherein the latch comprises two barbed wing members, wherein a first barbed wing member extends distally from a first edge of the planar member, and a second barbed wing member extends distally from a second edge of the planar member, wherein the first barbed wing member and the second barbed wing member are collinear.
6. (Canceled)
7. (Currently Amended) The latch of claim 1 6, wherein the pair of barbs ~~at least one barb~~ comprises at least one inclined planar member.
8. (Original) The latch of claim 7, wherein the latch is manufactured from a material selected from the group consisting of plastics, styrene, ABS, polystyrene, acrylic, polycarbonates, resin, and rubber.

9. (Previously Presented) A battery pack, comprising:
- a. at least one rechargeable battery cell;
 - b. a housing comprising a top and a bottom, into which the at least one rechargeable battery cell is placed, wherein the housing comprises at least one latch aperture for receiving a battery latch; and
 - c. a latch comprising:
 - a planar member configured for insertion to the battery pack in a first linear direction;
 - at least one spring retention post coupled to the planar member configured to receive a spring force of the rechargeable battery pack directed in a second linear direction opposite the first linear direction;
 - at least one insertion snap coupled to the planar member configured to resist the spring force and maintain the planar member at a particular position relative to the rechargeable battery pack until released therefrom; and
 - at least one barbed wing member, coupled to the planar member, the at least one barbed wing member extending distally outward from the planar member and supporting a pair of barbs extending perpendicularly from the at least one barbed wing member.
10. (Original) The battery pack of claim 9, further comprising a butterfly spring.
11. (Original) The battery pack of claim 10, wherein the latch aperture comprises at least one spring retention post.

12. (Original) The battery pack of claim 9, wherein the latch aperture comprises at least one slot for receiving the at least one insertion snap.

13. (Original) The battery pack of claim 9, wherein the latch aperture comprises at least one slot for receiving the at least one mechanical stop.

14. (Original) The battery pack of claim 9, wherein the latch aperture comprises at least one slot for receiving the at least one barbed wing member.
